Android tv raspberry pi 3 img

Skip to first unread messageunread,Mar 25, 2017, 10:33:35 PM3/25/17☐Sign in to reply to authorYou do not have permission to delete messages in this groupSign in to report message as abuseEither email addresses are anonymous for this group or you need the view member email addresses permission to view the original messageHello,I am trying to install Android TV 7.1 to my Raspberry Pi 3 and so far have installed this image to an SD card and booted the Pi. However, when it boots the screen is "torn" and stretched meaning I cannot read the dialog which seems to have appeared. I clicked enter twice and eventually the home screen appears, but any time the picture changes the screen flashes as the updates are made. It is not a good experience.Furthermore, I tried to install GAPPS using an installer script from RTAndroid, however I did not have success running this from macOS. I was able to install wget and the android adb tools, but the problem occurred when the script appeared to begin copying every file on my system to the pi... It quickly ran out of space. Could someone direct me to a script which would work on macOS?unread,Mar 31, 2017, 1:31:38 AM3/31/17☐Sign in to reply to authorYou do not have permission to delete messages in this groupSign in to report message as abuseEither email addresses are anonymous for this group or you need the view member email addresses permission to view the original messageI can't really help you in regards to the video driver issues you're experiencing as I don't have that much knowledge on the matter.But from what I've learned the past couple of days trying to install ATV with marshmallow source on my Pi3 is that the disc image partitions the SD with default sizes. You need a good disk/partition tool like gparted on ubuntu to see ext4 partitions and resize them to a size that would suit your needs and capacity of the SD.After that you can run the script again and install gapps without space errors.Finally you should strongly consider using a Linux distro to flash and adb into your pi as it makes the process a whole lot smoother.Hope this helpsunread,Mar 31, 2017, 1:17:02 PM3/31/17☐Sign in to reply to authorYou do not have permission to delete messages in this groupSign in to report message as abuseEither email addresses are anonymous for this group or you need the view member email addresses permission to view the original messageto Android-rpi, marin....@gmail.com The whole process requires a couple of installations and the execution of some other command from the Android terminal, so you better arm yourself with patience and follow the steps with ease. If everything goes as planned, you will end up with a small device with which you can turn any television into a very complete Smart TV.The performance offered by the Rasperry Pi may not be as expected, so we recommend doing it with a RaspBerry Pi 4 with 4GB of RAM, since the management of the services will be much more fluid than with other versions of the development board.What I need?A Raspberry Pi 3 or Raspberry Pi 4A microSD card of at least 16 GBA pendriveA LineageOS image for Raspberry Pi 3 or Pi4 depending on your modelThe OpenGApps packageThe Etcher appInstalling LineageOSThe first thing we will have to do is install Android on the RaspBerry Pi, and for this we will be based on LineageOS, an operating system based on that of Google that leaves us the Raspberry Pi perfectly configured to work immediately. The problem is that this will not be enough for it to do the functions of Android TV, so we will have to install additional packages so that everything is perfectly.Installing LineageOS on Rasperry PiWe start by installing LineageOS on our micro SD card. This is what you will have to do:Download the LineageOS version that corresponds to your version of Rasperry Pi and unzip the zip to get the .img image inside. If you are going to use a Raspberry Pi 3, download the version based on Android 8.1 (LineageOS 15.1) . If instead you have a Raspberry Pi 4, download the Android 9 version (LineageOS 16) .Record this image on your microSD card with the help of Etcher. You just have to choose the image location and the destination drive where the data will be recorded. Remember that this destination drive (your microSD card) will be completely erased.You have already installed LineageOS on the microSD card. Now enter it in your Raspberry Pi and let's start the system. The startup process will take a few minutes to complete. Once we are on the home screen, we will complete the configuration by selecting the time zone, language and other aspects.How to install GAppsWe already have a Raspberry Pi with Android functions, however, we still have to turn it into a full Android TV device, and for this we need to install Open GApps . This pack of applications will transform the installation into a fully functional Android version, so we will have to install it to achieve our goal.Of course, we will have to take into account a couple of factors, and that is that the Raspberry Pi 3 due to its performance, could have problems if we install the Android TV package in full. To avoid a malfunction, we will select the pico package , and if instead you have a Raspberry Pi 4, you can select the tvstock package . The installation process is similar, so you will not encounter problems in the following points:Download the package that best suits you for your Rasperry Pi, always in ARM version:Download Open GApps pico for version 8.1 on Rasperry Pi 3 Download Open GApss tvstock for version 9.0 on RaspBerry Pi 4Save the zip on a USB memory.Activate developer mode in LineageOS. To do this, press the Build Number option 7 times in Settings> Tablet Information.With developer mode unlocked you will need to enable root administrator access (Apps and ADB) in Settings> Developer Options.Also activate the local terminal in the option that you will find below.Connect the USB memory that you previously saved the .zip to.Open Terminal and type the following commands:# its# rpi3-recovert.y.sh >>>>>> (if you do it from a Rasperry Pi 3) # rpi4-recovery.sh >>>>>> (if you do it from a Rasperry Pi 4)When the process finishes, type reboot to reboot the system.The Rasperry Pi will now start in recovery mode. In this menu, we will have to choose the install option, and choose the .zip package that we have stored in the USB memory.Then, we will have to restore the factory settings with the Wipe option that you will find in the main menu.And finally, we will restart the Rasperry Pi in the operating system mode, to avoid re-entering the recovery mode. To do this, we will first have to activate the system partition in Mount> System. Then access the Advanced> Terminal menu, and run the following command:# rpi3-recovery.sh boot (if you do it from a Rasperry Pi 3)# rpi4-recovery.sh boot (if you do it from a Rasperry Pi 4)The system will restart and you will already have the Android version perfectly working. Remember that if you installed the Pico package for Rasperry Pi, you must install a Launcher to achieve the aesthetic similar to Android TV. android tv raspberry pi 3 img download. android tv image for raspberry pi 3
