How to draw full human body

Human blood consists of plasma, red blood cells, white blood cells and platelets. Blood density is only slightly more than pure water, and it consists of about 7% of a man's body weight. Therefore, the actual volume of blood will depend on the size of the person, their age, their sex, their hydration status, the volume of white blood cells and red blood cells in their blood, and their general state of health. An average adult weighing between 150 and 180 pounds will contain about 1.2 to 1.5 gallons of blood in their body. A child of about 80 pounds will contain about half the amount of blood as an adult. Sometimes referred to as "coconut hormone", oxytocin is released during sex and breastfeeding. But does it make you fall in love with someone or just tie you up with someone you already love? From Dave Roos The human body is really amazing. Look at these fantastic facts:1. About 80-90% of what we perceive as "taste" is actually due to our sense of smell. 2. Your heart beats about 35 million times in a year. During a medium life, the human heart will beat more than 2.5 billion times.3. Your body has about 5.6 liters of blood. This 5.6 liters of blood circulates through the body three times a minute. In one day, the blood travels for a total of 19,000 km (12000 miles)- which is four times the distance across the US from the coast to the coast.4. The heart pumps about 1 million barrels of blood during an average life -enough to fill more than 3 super tankers.5. If all the arteries, veins and capillaries of the human circulatory system were put to an end, the total length would be 60,000 miles, or 100,000 km. It's almost two and a half times around Earth!6. Although its average thickness only 2mm, the skin gets an eighth of all your blood supply.7. The skull looks like a single bone. In fact, it consists of 22 separate bones, cemented together along rigid joints called sutures.8. If the digestive tract of a human adult was elongated, it would be 6 to 9 m (20 to 30 ft).9. Red blood cells can live for about four months circulating throughout the body, feeding the 60 trillions of other cells in the body. Red blood cells make about 250,000 round trips of the body before returning to the bone marrow, where they were born, to die.10. Human hair grows about 1/4 inch (about 6 mm) each month and continues to grow up to 6 years. The hair then falls and another grows in its place.11. The healthy average mouth produces about 600 ml of saliva every day. Just fill a bottle of 12 ounces drink.12. The fastest nerve cells carry messages along their axes to an amazing 130 meters per second (268 mph). Human beings are probably the most complex organisms on this planet. Imagine billions of microscopic parts, each with its own identity, working together in an organized way for the benefit of total being. The human body is a single structure consisting of billions of smaller structures of four main types: Cells The cells have long been recognized as the simplest units of living matter that can keep life and reproduce. The human body, consisting of numerous cells, begins as a single newly fertilized cell. The tissues are more complex units than the cells. By definition, a tissue is an organization of a large number of similar cells with variable amounts and types of non-living and intercellular substance among them. Organs The organs are more complex units of the tissues. An organ is an organization of different types of fabrics so arranged that together they can perform a special function. For example, the stomach is an organization of muscles, connectives, epithelial and nervous tissues. The muscle and connective tissues form its wall, the epithelial and connective tissues form its coating, and the nervous tissue extends both for its wall and for its coating. Systems are the most complex of the human body components. A system is an organization of various numbers and types of organs so arranged that together they can perform complex functions for the body. Ten main systems make up the human body: « Previous (Anatomy & Physiology)Next (corporate functions & life process) » Several organs can work together to perform a common function, as well as parts of your digestive system break food. We refer to an integrated unit as an organ system. Groups of organ systems to create complete and functional organisms, like us! There are 11 large organ systems in the human body. The circulatory system is a body network of blood vessels and lymph. Powered by the heart, it is the body distribution system to organs with oxygen, hormones and essential nutrients that helps it to function properly. Read it. Learn more about these body parts in the circulatory system: Each tissue inside the body requires oxygen to work. The respiratory system, which includes air passages, pulmonary vessels, lungs and respiratory muscles, provides oxygenated blood to the body tissues and removes exhaust gases. Read it. Learn more about these body parts in the respiratory system: The skeletal system consists of the total sum of the muscles throughout the body moving the skeleton, maintain the posture through constant contraction and generate heat through cell metabolism. Human beings have three types of muscles. Read it. The nervous system allows us to perceive, understand and respond to the world around us. The nervous system also manages the essential physiological functions of the body, such as breathing and digestion. Read it.
