Chef's Table - The Magnum Room - The Harvest Room - Cooper Den Learn more By: Walt Stearns There are many things that are still waiting to be discovered in the underwater world, and you do not necessarily need of a research vessel and a scientific team to cross the unknown. This was certainly the case when I picked up the first known photographs of one of the Monsters of the Caribbean Sea. I was staying at the Anse Chastanet Resort on the island of Saint Lucia, which is located in the middle of the path of the Chain Island of the Caribbean. It was there that I heard of a mysterious Monster of Recife. I like island tales as much as the next expensive, but this seemed especially improbable. The local diving masters were a creature similar to a worm supposedly 15 length and so large as the arm of a man. Known simply as *A à é* "The thing *A à é*" was considered extremely indescribable, and only went out at night. It was also said to be especially sensitive to diving lights. In the words of a diving master , *A à é à é † §* "Mans, the lights make the holes rejoice faster than a Eltica. The Storied St. Lucia is a wide variety of a segmented marine worm, known for his sports. Genies Eunice Roussai. Never one to leave a good misty, no matter how improbable it may seem, I planned some night dives on the reefs around Anse Chastanet. To my surprise, I discovered that the thing really existed, and I was really able to take a picture of it! It was a very small speech in comparison with what the diving masters described - about four feet long and so thick as the My pulse. But he did not retreat the light. Maybe it was sick. Excited by my discovery, I spent some images for OM, I good friend Paul Human, He was working on the second review of his identification book of his reef creature and Ned Dloach, then realized if anyone could, Paul could identify him. The segmented marine work is known as the thing only goes out at night, and usually moves away from the diving lights. As it turned out, this was a new spy, never before identified. The best that any of the scientists were able to determine was that it belongs to the annelid filo, which means small ananis, which is a term applied to most segmented worms. *A é à é* "Merdos went as well as many marine worms are members of this philo *à é*" according to Paul. The most distinctive feature of this group is that your body is divided into a repetitive sequence of round segments. This marine variety of red (worms) is known as polaquetes. An example would be the bearded fireworm, commonly called bristle worm. In the creature I encountered, the body segments were a dark to reddish / purple brown with a shade similar to the feet, separated by deep creases with large cirri, which are the used ap societies *à é - f*. The breaths in the form of animal feathers were soft for the touch (yes, I touched one), running on both sides. It looked like a centiped spy. The body of the thing is covered with fine wires known as Cirri that provide locomotion. This work seems a bit like a As it moves through the slits of Recife. The identification of the thing is provision, since more taxonomic research need to be made once viable samples *à é* or tissue samples are obtained. The problem is Only they are nightlife, they are still considered extremely rare. The photos I still took between a small handful of images known in the record, with a few later assumed in the neighbor of Saint Lucia, the island of Dominica. In addition, there was a handful of sightings from Bahamas, until Bonaire and Curacao, in the south of the Caribbean. At the moment, all that anyone can say is that it belongs to the family of elongated worms Euniciidae, giving rise to his name of the species of genies: Eunice Roussai. And that inhabits deep recesses in the reef and can grow until six feet in length. The last part is speculative, already that scientists are not sure of how great this animal grows. Who knows, there may be a 15-foot monster outside in Recife. It may be you who will meet you. Do you want to look for the thing you really? Give us a connection in 800-330-6611 or shoot in us an email at sales@caradonna.com.d Special notification: on August 10, 2021 Our restaurant and shop were devastated by fire . Our lodge, located 100 meters north, remains open. You can make a reservation here. Lucia is perched on the coastal miles of any other negro. Local residents often frequency lucia lodge for messages, groceries, wifi and courtesy coffee houses. We regret the impact of this loss in both locals and our employees. The Lucia Store was opened in 1937, coinciding with the opening of Highway 1! The Earth was originally homesteadulated in 1800 by the Harlan family, and in that pioneering match of Harlan's plan to rebuild this vital part of the south coast of Big Sur. He weathered waves of the Pacific Ocean states in every corner and nooks of the coastal earth. The young and carefree mountains of Santa Lucia rush to know the challenge. The wedding finds a happy commitment as first the earth fingers of your way, then back in surrounding the sea. This eternal dance brings amazing views and hot smiles for everyone who visits. This is great sur. Along this dramatic corridor, perched above the surf and clinging to the cliffs of the ocean, lies Lucia Lodge. Building by one of the pioneering families of the XIX Big Sur, the Fifth Generation of the Harlan family receives you to Lucia village, named after the Metland Mountains that surround it. Make a real reserve Big sur online gifts and art functions by seascreate souvenirs with northern beach as your background. Ships by the beach wedding site Seabeautiful with exquisite views and delicious food. Dining by the modern Italian seafood restaurant of SEAA. Join us for exquisite meal while enjoying Panorean views of North Beach. Official Name: Sao Little Rea: 620 kilometers Square (239 Kilometers Square) Highest Point in Mainland: Mount Gimie (950 meters / 3,117 feet) Lower point on land: Sea level Hemisphá © Rios: North and Western Horry Spindle: 8 AM = Mido-day GMT Longer distances: 43 kilhemeters (27 miles) from north to south; 23 miles from east to land borders: no coast: 158 kilometers (98 miles) Territorial limits: 22 kilometers (12 miles ne) Santa Little, located in the Sea of the Eastern Caribbean between Martinique and SA f Vicente, is the second largest of the Ballavento Islands. With a 620-square-meter square area (239 square miles), Santa Lazy is almost three times and half as large as Washington, D.C. Santa Little do not have territory or dependence. The tropical climate of Santa Lucia is moderate by the comment of the winds of the Atlantic Ocean. The physician temperature all year round is about 27 ° C (80 ° F). The hurricanes are a danger at the end of the summer of June, July and August. The Annual Men's precipitation ranges from about 127 centimeters (50 inches) in the coastal areas to 381 centimeters (150 inches) in higher elevations inside. The rainy season of June to September, and the stage It is executed from February to May. The volcanically formed island consists of mountains and hills inside, surrounded by a coastal strip. Santa Labor is Between the Atlantic Ocean and the Caribbean Sea. The harbor waters in the port of Castries are 8 meters (27 feet) deep, but the underwater geography around the island varies dramatically. There are extensive coral reefs, sub-qatic speakers, walls and mountains in the waters that surround Santa Little. Santa Labor is separated from Martinique to the north by the Santa Labor Canal, and of Vicente to the south by the passage of Vicente. In addition to the main island, Santa Lazor also includes the Mary Islands, located by the southeast coast. The Mary Islands contain a nature reserve. Santa Labor has two large ports: Castries and Vieux Fort. The East Coast has many small clippings, while the West Coast is mostly softer, with large cuts in the port of Castries in the Northwest and SougríÁ're Bay, in the southwest, in which the mountain peaks of Gros Piton and Petit Piton is The localized. The island has two large covers, boundary boundary on its northern tip and mood áf chic in the south. Santa Labor is known for its many scenic beaches, some of which are covered with black vulcane sand. Santa Labor does not have considerable lakes. A number of small rivers flow out of the central tall lands to the coast. The mains are the Cul de Sac, Canelles, Denery, Fond, Playe, Doree, Canárias, Roseau and Marquis Rivers. There are no deserts in Santa Little. A narrow strip of coastal plans frowning the outer permeal of Santa Labor, giving place to the soup for the interior. Half the north of the island is Hillier, while half half is more mountainous. Summits similar to the cone of Gros Piton and Petit Piton are the excellent natural characteristics of Santa Lucia. Mountains occupy much part of the interior of the country, covering the island of north to south. Although the largest elevation is in the southern central part of the island, where Mount Gimie reaches a height of 950 meters (3,117 feet), the most well-known peaks of the country are Gros Piton and Petit Piton. These pichins of the volcanic rock rises from the ocean in the souffron bay, on the southwest coast, in elevations of 798 meters (2,619 feet) and 750 meters (2,461 feet), respectively. There are underwater caves carved out of Santa Labor's coral reefs, which are a popular spot for divers. Santa Labor does not have platans and no significant monastery. The deep ravid of Rosau of 91 meters A (300 feet), completed in 1995, has a capacity of more than 2.6 billion liters (700 million gallons) water. The Tunnel Castries / Cul de SAC, I concluded at the beginning of 2000 and dubbed the Milanian Highway, connects the city of Castries with the valley of the Cul de Sac. 14 Read further Eggleston, George Teeeele.
