Block google ads android phone

While many web sites depend on revenue coming from ad banner impressions and clicks, it's a fact that some of these ads can be very annoying, and in a few cases even malicious. Some ads are created by rogue pop-up pages, while others automatically start playing video or audio clips. Many more are guilty of just taking up too much of your phone's resources with overused animations.**Read more: How to block websites on Android**So what if you wanted to block ads on Android? Thankfully, there are a number of ways you can do just that, and a couple of them just require that you make a few setting changes in your Chrome web browser. In fact, Google has been tackling this issue for a while now; for example, all versions since Chrome 66 mute auto-playing videos by default.**Block pop up pages and ads in Chrome**If you do use Chrome as your default web browser on your Android phone, and most of you do, you should be aware that in 2018, Google announced that Chrome would block all ads on websites if they use full-page interstitials. Sites would also see ads blocked on Chrome if they unexpectedly play sounds, or if they use a lot of flashing-style animation.**However**, some sites still use pop-ups to generate ads, and thankfully there's a way to combat them in Chrome:**Open up the Chrome browser.**Tap on the menu on the top right side, and then tap on Settings.**Scroll down to the Site Settings selection, and tap on it.**Scroll down until you see the Pop-ups and Redirects option and tap on it**Tap on the slide to disable pop-ups on a website.**There's also a section called Ads in Site Settings. Go back to Site Settings and tap on Ads.**Tap on the slider, so that Chrome can disable some ads that are considered "intrusive."**Use Data Saver mode in Chrome**There's another lesser-known method that could save you from seeing some annoying or malicious websites and ads while using Chrome. Just go to the main menu again, tap on Settings, then scroll down to Lite Mode, and then turn it on. The main purpose of Data Saver is to keep down downloads while using the browser by having it access Google servers that compress web site pages before Chrome actually downloads them.**Google's compression servers are also used by Data Saver to detect and do away with web pages that may have harmful or malicious ads. While the sites may not look the same using Data Saver, they are safer to download and browser versus viewing the sites without this mode turned on.**Read more: Chrome for Android tips and tricks you should know about****Install ad blocking extensions or use browsers with ad blocking features**While Chrome now has some ad blocking features, it's not perfect. Another solution is to download ad blocking extensions for Chrome. They include AdBlock and Adblock Plus (no relation), and they should do away with more annoying ads more effectively than by using Chrome alone. Another method is to just use another web browser with its own integrated ad-blocking features. Some of the options available on Android include Opera, and even Adblock has its own stand-alone web browser.**Get Opera from Google Play****Get Adblock Browser from Google Play****So now you know how to block ads on Android. While annoying or harmful web ad banners and pop-ups are not going away, there are plenty of ways you can stay safe from their effects for a better browsing experience. Source: Android.com** Google announced its Android One line of cheap smartphones, intended for buyers in emerging markets, last September. At the time, the company touted the initiative as the fix to bring "the next five billion" users online, with its promise of low-cost hardware, the latest version of the Android operating system, and the full complement of Google's mobile software. As Mark Bergen reports for Re/Code, Android One was counted among the many efforts to spread Internet access globally, and was seen internally as an attempt to avoid "another China," where Android is popular but typically comes without access to Google's service. It was also seen as a hedge against Facebook, which is becoming the gateway to the Internet in many parts of the world. But so far, it's accomplished none of those goals. Android One began with a splashy marketing push, but has been a disappointment ever since. Consumers and manufacturing partners have been reluctant to get on board. The program spread quickly, most recently reaching its seventh country, Turkey, in May. Google is expected to announce an additional OEM partner in India, which would make the 11th Android One device. Each existing Android One device runs on Android Lollipop 5.1, and Google is moving toward updating them to the next version — a rarity in emerging markets. But Google has largely failed to get those phones into the hands of consumers. Analysts estimate that in the program's first 100 days, about 700,000 Android One phones were shipped, mostly in India. The same number shipped in the subsequent five months. As it did in India, Google recruited national manufacturers in Indonesia and Bangladesh. But those hardware partners are still growing, and lack the muscle of larger Android phone manufacturers, like Samsung. Neil Shah, a director at Counterpoint Research, told Bergen that "Google has been able to rope in 'local kings.' But the competition has been even more aggressive than the Android One phones. The sub-\$100 retail dream and the corresponding execution didn't go exactly as it was planned." Part of the problem was that Google forged partnerships with country-specific hardware manufacturers, instead of global giants. These local manufacturers were a logical target, since they are growing across Asia and are willing to adhere to Google's requirements for Android One. But their target market, of super-cheap phones, is cutthroat and pits them against global giants like Samsung and Motorola plus newcomers like Xiaomi. To succeed, manufacturers need profit or volume. In a market where margins are razor-thin, Google's Android One program has delivered neither. Because Android One offers little room for innovation, thanks to its prohibition of software customizations, the best that manufacturers could hope for is volume. But the Android One smartphones haven't gained traction in a competitive market — in part because Google's hardware partners have largely "bailed" on marketing the devices. Source familiar with Android One's launch in India told Re/Code that Google failed to assemble a viable strategy to sell the phones, and most phones sold in India and in similar markets are sold in small, rural retail outlets. Google's decision to delay offline sales for three months also upset retailers. Google seems to have failed to foresee its marketing issues, as it also failed to predict the internal stress that the initiative has reportedly caused. Bergen notes that a central goal of Android One is to get more devices running on the latest version of Android, but that necessitates the coordination of updates across all of the Android One handsets in seven different markets — a taxing and "thankless" task for Android engineers. Google is also troubled by the lack of revenue from Android, and by the challenges of getting people to use Android and the latest version of Google services. In India, for instance, many Android users turn off Google Now because it uses too much data. But Bergen notes that it will take time for Google to encourage the mobile industry to run more current and more uniform software. That's an ambition where playing the long game is most likely to pay off, and Bergen notes that Android One is similar to Google's Chromebooks program. The inexpensive PCs first launched in 2011, but are just now beginning to claim noteworthy market share. It's possible that Android One smartphones, similarly, could need several years to take hold among consumers. But in the meantime, Google has some problems to solve with the program. The Economic Times reports that the three Indian smartphone manufacturers who initially created Android One phones have no plans to develop further devices for the platform. Micromax, Karbonn, and Spice are clearing out the stock they have at discounted prices, and Intex, Lava, and Xolo, which planned to join the program, aren't as enthusiastic about it now. Despite speculation that Google will discontinue the program altogether, the company says that it's pushing ahead with the initiative. "We're not backing away from the programme," Caesar Sengupta, vice president of product management at Google, told the Times. "We've learnt a lot from the initial round with our partners and they have learnt in terms of device availability, in channel and others. Over time, as we work with our partners, we will keep working on making sure that we do things much better." More from Tech Cheat Sheet: how to block google ads on my android phone
